

Inline Suggestions (IDE Completions)

A dark-themed IDE window titled 'parser.py' displays a Python function `calculate_stats`. The function calculates summary statistics from a list of data. An 'AI suggestion' bubble points to the `return` statement, which is currently returning a dictionary with keys `'mean'`, `'total'`, and `'count'`.

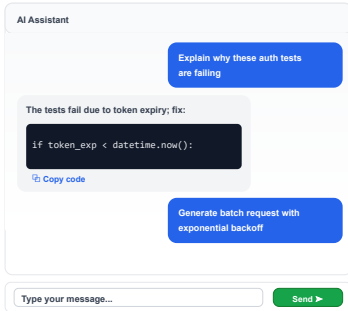

```
def calculate_stats(data):  
    """Calculate summary statistics from data"""  
    if not data:  
        return None  
    total = sum(data)  
    mean = total / len(data)  
    return {  
        'mean': mean,  
        'total': total,  
        'count': len(data)  
    }
```

Chat-based Interaction

A chat interface titled 'AI Assistant'. A blue bubble contains the prompt: 'Explain why these auth tests are falling'. The assistant's response is: 'The tests fail due to token expiry; fix:'. Below this is a code block containing `if token_exp < datetime.now():`, with a 'Copy code' link. A second blue bubble contains the prompt: 'Generate batch request with exponential backoff'. At the bottom is a text input field 'Type your message...' and a 'Send' button.

AI Assistant

Explain why these auth tests are falling

The tests fail due to token expiry; fix:

```
if token_exp < datetime.now():
```

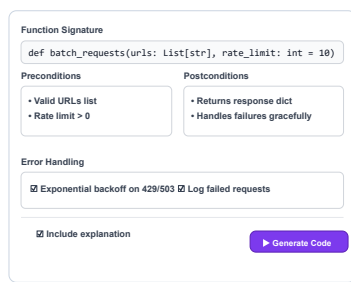

[Copy code](#)

Generate batch request with exponential backoff

Type your message... Send ▶

Structured Prompts (Form Schema)

A form schema for a function `batch_requests`. It includes sections for 'Function Signature', 'Preconditions', 'Postconditions', and 'Error Handling'. The 'Generate Code' button is at the bottom right.

Function Signature

```
def batch_requests(urls: List[str], rate_limit: int = 10)
```

Preconditions

- Valid URLs list
- Rate limit > 0

Postconditions

- Returns response dict
- Handles failures gracefully

Error Handling

☒ Exponential backoff on 429/503 ☒ Log failed requests

☒ Include explanation

▶ Generate Code

- › Structured form constrains request format
- › Generates code with rationale explanation
